

Machine Intelligence

We help our customers build intelligent machines to automate, optimise, and outperform.

Machine Intelligence's Expertise

Machine Intelligence has a unique AI technology that allows for the direct generation of human readable solutions with minimal training examples. Although our technology is application and data type agnostic, we have focused on solutions for processing image and image-like data such as x-ray, ultrasound and CT for the NDT market. Our solution outputs trustable, explainable models built from existing concepts.

1

Developers of unique AI technology

This is a white-box solution and does not use LLMs. Our technology can run 100% locally with models output as real source code for direct integration

2

Bespoke software development and integration

It is easy to integrate with existing software, and the ability to generate human readable models - including source code means deployment is easy and can meet regulatory needs.

3

R&D services

We provide research and development support to help deliver a solution - taking it from TRL1 to TRL9.

Role in SmarterLink

SmarterLink will allow for rapid integration of our AI technologies into your products.

Development of a common framework to transfer image and other NDT data to our AI for analysis

Real-time analysis back end with support for multiple models

Scalable AI during learning and deployment using SmarterLink as an integration technology
